Appl. No. 10/684,312

EXAMPLE CLAIMS FOR DISCUSSION

28. A device facilitating the heating of items, the device comprising:

a collapsible frame for suspending an item above a heat source, the frame having a plurality of sides, at least one of the sides being designated as a first side and the sides other than the designated first side collectively constituting the remainder of the frame;

a plurality of available panels, each of which is configured to be used in enclosing the first side by being removably attached to the remainder of the frame;

wherein the first side is constructed using at least one panel from among the plurality of panels available for enclosing the first side;

wherein the at least one panel supports at least one grill within the frame; and

wherein the remainder of the frame is equipped to accommodate multiple panels concurrently when said multiple panels are optionally stacked to form the first side.

29. The device of claim 28 wherein each one of the panels among the plurality of available panels is configured to removably attach to the remainder of the frame along at least two non-adjacent edges of the panel.

31. The device of claim 28 wherein at least one panel of the plurality of panels is able to be removably attached at more than one possible position of attachment with respect to the remainder of the frame.

32. The device of claim 31 wherein the position of attachment of the panel determines a height at which the grill, supported by at least one panel, is supported within the frame.

33. The device of claim 28 wherein the first side is, in a first instance, constructed of a first quantity of panels to establish a first height at which the grill, supported by one of the panels of the first side, is supported within the frame and, in a second instance, alternatively constructed of a second quantity of panels to establish a second height, different from the first height, at which the grill is supported within the frame.
